

Hazardous Materials Management Services

Cuoco & Cormier Engineering Associates, Inc. offers a variety of hazardous materials management services to our clients. Sample projects include the following:

Massachusetts Department of Environmental Protection - Boston, Ma:

C&C has been contracted by the MA DEP to work with local schools to improve chemical management, direct the disposal of high hazard materials, and promote regulatory compliance. This project has involved the evaluation of school chemical inventories to identify and qualify potentially hazardous conditions; the development of environmental management systems to control chemical purchases and hazardous materials disposal. These efforts have also involved coordination with local emergency responders and school officials to conduct a safety evaluation of the schools and to develop emergency procedures for use in the event of a chemical spill or fire at the school.

Covanta Energy - Haverhill, Massachusetts:

Covanta Energy operates a trash to energy plant in Haverhill. C&C supports Covanta's pollution prevention efforts by providing mercury assessment, education and recovery services to schools and healthcare facilities located within the Covanta service area. C&C audits these facilities to identify mercury products. In addition, C&C works with these facilities to replace the mercury products with non-toxic alternatives and to establish effective recovery programs to prevent obsolete mercury products from being discarded at the Covanta incinerator. This approach has helped to lower the mercury emissions leaving the Covanta Energy plant.

Town of Ipswich Planning Board - Ipswich, Massachusetts:

C&C conducted an environmental, health and safety review of a 150,000 square foot biotechnology laboratory and production facility in order to review compliance with local permitting requirements and to assist municipal emergency planning efforts. This project involved the review of research labs, production facilities and a waste water treatment plant. C&C was able to offer the community a number of recommendations to enhance hazardous materials management, emergency planning, and water conservation.
